

Original

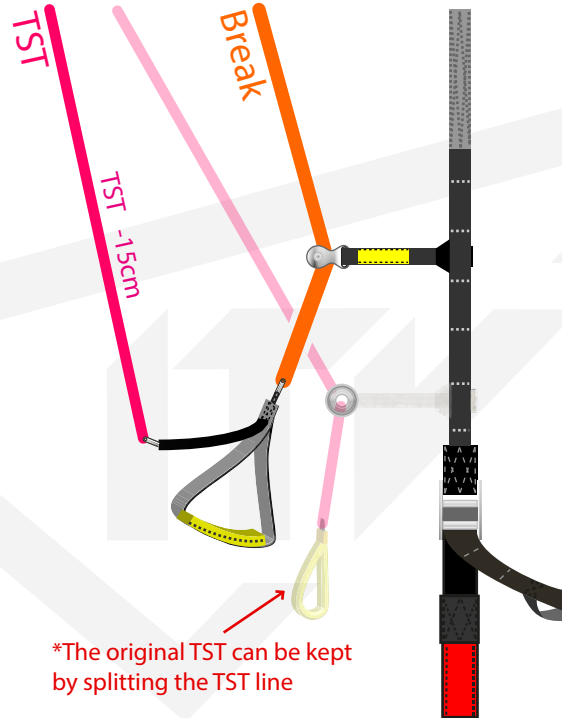

The Piper comes standard with the TST separate from the main brake line. This assembly allows a great comfort in navigation and a 2D use by taking the 2 handles in hand.

2D System

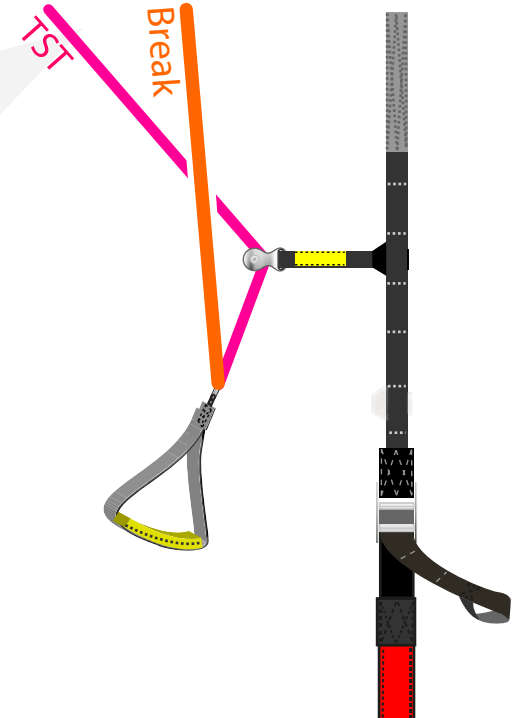

2D* or Air Race* handles are required for this setup. The TST line must be connected to the 2D handle by shortening it by 15cm. It is possible to split the TST command and keep the original TST system in place.

* to order as an option

3D System

The TST line and the brake control are connected with the same lengths and in the same place on the original handle. The TST line passes into the pulley, and the break line is free. Attention, this assembly implies an unusual 3D piloting gesture and requiring an adaptation of the pilot. (3D: Horizontal action outward and/or vertical depending on the desired action)
